Application of Graph Theory In Transportation 1

Application of Graph Theory In Transportation 2 This thesis considers a number of problems in graph theory a graph are an abstract mathematical structure formed by a set of vertices and edges. Joining pair of those vertices Graph can be used to model the connections between objects for instance. A computer network can be modeled as a graph with each server represented by a vertex and the connections between those servers represented by edges. Many problems in graph theory involve some transported problem that is assignment of transport to the edges or vertices of a graph. Such problems fall broadly in to two categories that first type of problem concerns the possibility of assigning transport to a graph while respecting some set of rules ; the second concerns the existence of colored structures in a graph whose transport we do not control . The field of graph transportations its origins to 1805-1865 when WILLIM ROWAN HAMILTON observed that a map of the counties of England can be define Hamilton shortest paths and 'ORE.S THEOREM.

Application of Graph Theory In Transportation 3 The archetypal problem of the second type also phrased in a non – abstract form as follows: however finding the exact answer to this general problem is not odiously An interesting future of many problems in graph theory is the contrast between the case with which they may be stated and apparent difficulty of their solution. This contrast is also apparent in most of the problems considered in this thesis Before formally introducing thru main themes and problems considered in this thesis, we must give a few key definitions

Graph theory networks transportation has

always been important in transportation and telecommunication. They have more important for all operation network transportation today. The internet has connected virtually everything today. It has connected everybody and everything and everywhere

in to a network

transportation.

The motivation for these Theses is network in transportation the mathematics or use of mathematics in transportation networks.

The graph theory is one such field of mathematics which cuts across wide range of disciplines of human understanding not only in the areas of pure mathematics but also in variety of application
